

CRIMP- FITTINGS

The Greenglobe Crimped Fittings are mainly suitable for low pressure gas applications.

These fittings have many benefits in the process of gas connection and commissioning.

It has the advantage that the product and fittings are lower in cost when compared to similar steel tubing systems. This saves both the plumber and consumer money!

The product is light weight, bendable and does not need to be welded. A crimp fitting system is used to make the installation task easy.

Installation times are significantly reduced in comparison to traditional Steel Piping systems saving labour on each and every job. This increases productivity and further reduces the costs of installation.
